

Blockbuster/Drain Corp Joint Venture Projects.

Short line under trees in Benoni.

A home owner had been having ongoing problems with a Santar sewer that went under some trees in her garden. The cost and inconvenience of chopping down the trees and destroying the garden convinced the owner to go with our trenchless replacement method.

New pipe under a palm tree!

This was a fairly simple project – about 10m under trees with one lateral coming in.

New pipe through lateral.

The job was completed within a day – the garden was returned to its pristine state and the tree was not harmed in any way!

The Benefits of using BB&DC's pipe replacement method

1. The most cost effective solution – especially if you need to go under buildings, walls, paving and tarred roads.
2. Minimal disruption to the property – we only dig a series of small pits.
3. Little or no contamination of the area we work in – we don't dig up all the contaminated earth and spread it around as you would have to using conventional methods.
4. We can replace the pipe in heavily contaminated ground that is in fact nothing less than a septic tank. The contaminants stay where they are and will ultimately become inert.
5. The replacement is quick and disruption to sewerage flow minimal.
6. Pipe is replaced. You thus have a brand new pipe that is round and smooth inside with no compromised structural integrity.
7. **Immensely strong HDPE (class 6-10) pipe with a minimum of joins will provide hassle free sewerage flow for the next 100 years!**
